

# 30mm Propellants AFP-001

## Performance and Power

The AFP-001 is designed specifically for medium caliber light material. Because the 30mm propellant is used in training rounds, it requires precision ballistics that ballistically match the PGU13/B HEI cartridge.

Made from a single base, solvent formulation, ATK's 30mm propellant maintains a steady burn and pressure rise in order to maintain the integrity of 30mm projectiles, like the PGU-13 HEI.

Since AFP-001 can be manufactured to match the ballistic characteristics of tactical rounds, this propellant is also available for test and training round applications.

### AFP-001 for 30mm Characteristics

- Formulation: Single base solvent
- Geometry: Single perf cylinder
- Velocity: 1020 meters per second
- Pressure: 360 MPa
